Execution

Debugging

Is this a bug?

from: John Regehr (on Twitter)

Assertions

An <u>Assertion</u> is a statement to detect a violated assumption. An assertions represents an *invariant* in the code

<u>Error/Exception</u> can indicate "exceptional" conditions (invalid user input, missing files, etc.)

- Exceptions are more robust but slower
- Error are fast but difficult to handle in complex programs

```
#include <cassert> // <-- needed
int sqrt(int value) {
   int ret = sqrt_internal(value);
   assert(ret >= 0 && (ret == 0 || ret == 1 || ret < value));
   return ret;
}</pre>
```

<u>Assertions</u> may slow down the execution. They can be disable by define the <u>NDEBUG</u> macro

```
#define NDEBUG // or with the flag "-DNDEBUG"
```

Execution Debugging (gdb)

How to compile and run for debugging:

```
g++ -g [-ggdb3] <program.cpp> -o program
gdb [--args] ./program <args...>
```

-g Enable debugging

- stores the symbol table information in the executable (mapping between assembly and source code lines)
- for some compilers, it may disable certain optimizations
- slow down the compilation phase

-ggdb3 Produces debugging information specifically intended for gdb

- the last number produces extra debugging information, for example: including macro definitions
- in general, it is not portable across different compiler (supported by gcc, clang)

${\tt gdb-Break points/Watch points}$

Command	Abbr.	Description
breakpoint <file>:<line></line></file>	Ъ	insert a breakpoint in a specific line
breakpoint <function_name></function_name>	Ъ	insert a breakpoint in a specific function
breakpoint < ref > if < condition >	b	insert a breakpoint with a conditional statement
delete	d	delete all breakpoints or watchpoints
${\tt delete} < breakpoint_number >$		delete a specific breakpoint
<pre>clear [function_name/line_number]</pre>		delete a specific breakpoint
$\verb"enable/disable" < breakpoint_number>$		enable/disable a specific breakpoint
watch < expression>		stop execution when the value of expression changes (variable, comparison, etc.)
		8/69

gdb - Control Flow

Command	Abbr.	Description
run [args]	r	run the program
continue	С	continue the execution
finish	f	continue until the end of the current function
step	s	execute next line of code (follow function calls)
next	n	execute next line of code
until <pre>cprogram_point></pre>		continue until reach line number, function name, address, etc.
CTRL+C		stop the execution (not quit)
quit	P	exit

gdb - Stack and Info

Command	Abbr.	Description
list	1	print code
<pre>list < function or #start,#end></pre>	1	print function/range code
up	u	move up in the call stack
down	d	move down in the call stack
backtrace	bt	prints stack backtrace (call stack)
$\mathtt{backtrace} < \mathit{full} >$	bt	print values of local variables
help [<command/>]	h	show help about command
<pre>info <args breakpoints="" local="" registers="" watchpoints=""></args></pre>		show information about program arguments/breakpoints/watchpoints/ registers/local variables

gdb - Print

Command	Abbr.	Description
print <variable></variable>	р	print variable
print/h < variable>	p/h	print variable in hex
print/nb < variable>	p/nb	print variable in binary (n bytes)
print/w <address></address>	p/w	print address in binary
p /s <char address="" array=""></char>		print char array
p *array_var@n		print n array elements
<pre>p (int[4])<address></address></pre>		print four elements of type int
p *(char**)& <std::string></std::string>		print std::string

gdb - Disassemble

Command	Description
disasseble <function_name></function_name>	disassemble a specified function
disasseble <0xStart,0xEnd addr>	disassemble function range
nexti <variable></variable>	execute next line of code (follow function calls)
stepi < <i>variable</i> >	execute next line of code
x/nfu <address></address>	examine address n number of elements, f format (d: int, f: float, etc.), u data size (b: byte, w: word, etc.)

The debugger automatically stops when:

- breakpoint (by using the debugger)
- assertion fail
- segmentation fault
- trigger software breakpoint (e.g. SIGTRAP on Linux) github.com/scottt/debugbreak

Full story: www.yolinux.com/TUTORIALS/GDB-Commands.html (it also contains a script to de-referencing STL Containers)

gdb reference card V5 link

Memory Debugging

Memory Vulnerabilities

"70% of all the vulnerabilities in Microsoft products are memory safety issues"

Matt Miller, Microsoft Security Engineer

Terms like buffer overflow, race condition, page fault, null pointer, stack exhaustion, heap exhaustion/corruption, use-after-free, or double free – all describe **memory safety vulnerabilities**

 $\underline{\mathtt{valgrind}}$ is a tool suite to automatically detect many memory management and threading bugs

Website: valgrind.org

How to install the last version:

```
$ wget ftp://sourceware.org/pub/valgrind/valgrind-3.15.0.tar.bz2
$ tar xf valgrind-3.15.0.tar.bz2
$ cd valgrind-3.15.0
$ ./configure --enable-lto
$ make -j 12
$ sudo make install
$ sudo apt install libc6-dbg
```

Basic usage:

- compile with ¬g
- \$ valgrind ./program <args...>

Output example 1:

Output example 2:

```
!!memory leak
==19182== 40 bytes in 1 blocks are definitely lost in loss record 1 of 1
==19182==
            at 0x1B8FF5CD: malloc (vg replace malloc.c:130)
==19182== by 0x8048385: f (a.c:5)
==19182== by 0x80483AB: main (a.c:11)
==60127== HEAP SUMMARY:
==60127==
             in use at exit: 4,184 bytes in 2 blocks
==60127==
          total heap usage: 3 allocs, 1 frees, 4,224 bytes allocated
==60127==
==60127== LEAK SUMMARY:
==60127==
            definitely lost: 128 bytes in 1 blocks !!memory leak
==60127==
            indirectly lost: 0 bytes in 0 blocks
==60127==
              possibly lost: 0 bytes in 0 blocks
==60127==
            still reachable: 4,184 bytes in 2 blocks !!not deallocated
==60127==
                 suppressed: 0 bytes in 0 blocks
```

Advanced flags:

- --leak-check=full print details for each "definitely lost" or "possibly lost" block, including where it was allocated
- --show-leak-kinds=all to combine with --leak-check=full.
 Print all leak kinds
- --track-fds=yes list open file descriptors on exit (not closed)
- --track-origins=yes (very slow execution)

```
valgrind --leak-check=full --show-leak-kinds=all
    --track-fds=yes --track-origins=yes ./program <args...>
```

Track stack usage:

```
valgrind --tool=drd --show-stack-usage=yes ./program <args...>
```

Sanitizers

Address Sanitizer

Sanitizers are compiler-based instrumentation components to perform *dynamic* analysis

Sanitizer are used during development and testing to discover and diagnose memory misuse bugs and potentially dangerous undefined behavior

Sanitizer are implemented in Clang (from 3.1), gcc (from 4.8) and Xcode

Project using Sanitizers:

- Chromium
- Firefox
- Linux kernel
- Android

Address Sanitizer

Address Sanitizer is a memory error detector

- heap/stack/global out-of-bounds
- memory leaks
- use-after-free, use-after-return, use-after-scope
- double-free, invalid free
- initialization order bugs
- etc.
- * Similar to valgrind but faster (2X slowdown)

```
clang++ -01 -g -fsanitize=address -fno-omit-frame-pointer cprogram>
```

-01 disable inlining

-g generate symbol table

Website:

```
\label{lem:clang.llvm.org/docs/AddressSanitizer.html} github.com/google/sanitizers/wiki/AddressSanitizer gcc.gnu.org/onlinedocs/gcc/Instrumentation-Options.html
```

Leak Sanitizer

LeakSanitizer is a run-time memory leak detector

- integrated into AddressSanitizer, can be used as standalone tool
- * almost no performance overhead until the very end of the process

```
g++ -01 -g -fsanitize=address -fno-omit-frame-pointer clang++ -01 -g -fsanitize=leak -fno-omit-frame-pointer cprogram>
```

Website:

```
{\tt clang.llvm.org/docs/LeakSanitizer.html} \\ {\tt github.com/google/sanitizers/wiki/AddressSanitizerLeakSanitizer} \\ {\tt gcc.gnu.org/onlinedocs/gcc/Instrumentation-Options.html} \\
```

Memory Sanitizers

Memory Sanitizer is detector of uninitialized reads

- stack/heap-allocated memory read before it is written
- * Similar to valgrind but faster (3X slowdown)

```
clang++ -01 -g -fsanitize=memory -fno-omit-frame-pointer program>
```

```
-fsanitize-memory-track-origins=2
  track origins of uninitialized values
```

Note: not compatible with Address Sanitizer

Website:

```
clang.llvm.org/docs/MemorySanitizer.html
github.com/google/sanitizers/wiki/MemorySanitizer
gcc.gnu.org/onlinedocs/gcc/Instrumentation-Options.html
```

Undefined Behavior Sanitizer

UndefinedBehaviorSanitizer is a undefined behavior detector

- signed integer overflow, floating-point types overflow, enumerated not in range
- out-of-bounds array indexing, misaligned address
- divide by zero
- etc.
- * Not included in valgrind

```
clang++ -01 -g -fsanitize=undefined -fno-omit-frame-pointer cprogram>
```

```
-fsanitize=integer C
```

Checks for undefined or suspicious integer behavior (e.g. unsigned integer overflow)

-fsanitize=nullability

Checks passing null as a function parameter, assigning null to an Ivalue, and returning null from a function

Website:

clang.llvm.org/docs/UndefinedBehaviorSanitizer.html
gcc.gnu.org/onlinedocs/gcc/Instrumentation-Options.html

Debugging Summary

How to Debug Common Errors

Segmentation fault

- gdb
- valgrind
- lacksquare Segmentation fault when just entered in a function ightarrow stack overflow

Double free or corruption

- gdb
- valgrind

Infinite execution

■ gdb + (CTRL + C)

Incorrect results

valgrind + assertion + gdb + UndefinedBehaviorSanitizer

Demangling

Name mangling is a technique used to solve various problems caused by the need to resolve unique names

Transforming C++ ABI (Application binary interface) identifiers into the original source identifiers is called **demangling**

Example (linking error):

```
_ZNSt13basic_filebufIcSt11char_traitsIcEED1Ev
```

After demangling:

```
std::basic_filebuf<char, std::char_traits<char> >::~basic_filebuf()
```

How to demangle:

```
■ make |& c++filt | grep -P '`.*(?=))'
```

Online Demangler: https://demangler.com

Code Checking and

Analysis

Compiler Warnings

Enable specific warnings:

```
g++ -W<warning> <args...>
```

Disable specific warnings:

```
g++ -Wno-<warning> <args...>
```

Common warning flags to minimize accidental mismatches:

-Wall Enables many standard warnings (\sim 50 warnings)

-Wextra Enables some extra warning flags that are not enabled by -Wall ($\sim \! 15 \text{ warnings})$

-Wpedantic Issue all the warnings demanded by strict ISO C/C++

Enable <u>ALL</u> warnings (only clang) -Weverything

GCC Warnings

Additional GCC warning flags (≥ 5.0):

```
-Wcast-align
-Wcast-qual
-Wconversion
# -Wfloat-conversion
# -Wsiqn-conversion
-Wdate-time
-Wdouble-promotion
-Weffc++
# -Wdelete-non-virtual-dtor
\# -Wnon-virtual-dtor
-Wformat-signedness
-Winvalid-pch
-Wlogical-op
-Wmissing-declarations
-Wmissing-include-dirs
-Wodr
```

```
-Wold-style-cast
-Wpragmas
-Wredundant-decls
-Wshadow
-Wsign-promo*
-Wstrict-aliasing
-Wstrict-overflow=1 # 5
-Wswitch-bool
# -Wswitch-default
# -Wswitch-enum
-Wtrampolines
-Wunused-macros
-Wuseless-cast
-Wvla
-Wformat=2
-Wno-long-long
```

GCC Warnings

Additional GCC warning flags (≥ 8.0):

```
-Wcatch-value=2
-Wextra-semi
-Wstringop-truncation
-Wsuggest-attribute=cold
-Wsuggest-attribute=malloc
-Walloca
-Wduplicated-branches
-Wformat-overflow=2
-Wformat-truncation=2
-Wstringop-overflow=3
-Wduplicated-cond
-Wnull-dereference
-Wplacement-new=2
-Wshift-overflow=2
```

Full story:

```
gcc.gnu.org/onlinedocs/gcc/Warning-Options.html
github.com/barro/compiler-warnings
```

Static Analyzers - clang static analyzer

The <u>Clang Static Analyzer</u> is a source code analysis tool that finds bugs in C/C++ programs at compile-time Website: clang-analyzer.llvm.org

It find bugs by reasoning about the semantics of code (may produce false positives)

Example:

```
void test() {
   int i, a[10];
   int x = a[i]; // warning: array subscript is undefined
}
```

How to use:

```
scan-build make
```

scan-build is included in the LLVM suite

Static Analyzers - cppcheck

<u>Cppcheck</u> provides code analysis to detect bugs, undefined behavior and dangerous coding construct. The goal is to detect only real errors in the code (i.e. have very few false positives)

Website: cppcheck.sourceforge.net

```
cmake -DCMAKE_EXPORT_COMPILE_COMMANDS=ON .
cppcheck --enable=<enable_flags> --project=compile_commands.json
```

Static Analyzers - PVS-Studio/FBInfer

<u>PVS-Studio</u> is a high-quality *proprietary* (free for open source projects) static code analyzer supporting C, C++

Website: www.viva64.com/en/pvs-studio

Customers: IBM, Intel, Adobe, Microsoft, Nvidia, Bosh, IdGames,

EpicGames, etc.

<u>FBInfer</u> is a static analysis tool (also available online) to checks for null pointer deferencing, memory leak, coding conventions, unavailable APIs, etc.

Website: fbinfer.com

 ${\it Customers} : \ {\it Amazon AWS}, \ {\it Facebook/Ocolus}, \ {\it Instagram}, \ {\it Whatapp},$

Mozilla, Spotify, Uber, Sky, etc.

Static Analyzers - DeepCode

<u>deepCode</u> is an Al-powered code review system, with machine learning systems trained on billions of lines of code from open-source projects

Website: www.deepcode.ai

Available for Visual Studio Code and Atom

Code Testing

Unit Test

Unit testing involves breaking your program into pieces, and subjecting each piece to a series of tests

Unit Testing Benefits:

- Increases confidence in changing/ maintaining code
- The cost of fixing a defect detected during unit testing is lesser in comparison to that of defects detected at higher levels
- Debugging is easy. When a test fails, only the latest changes need to be debugged

C++ Unit testing frameworks:

- catch-lib
- Google Test
- CppUnit
- Boost.Test

 $\underline{\mathtt{Catch2}}$ is a multi-paradigm test framework for C++

Website: catch-lib.net

Catch2 features

- Header only and no external dependencies
- Assertion macro
- Floating point tolerance comparisons

Basic usage:

- Create the test program
- Run the test

```
$./test_program [<TestName>]
```

Other commands:

github.com/catchorg/Catch2

```
#define CATCH CONFIG MAIN // This tells Catch to provide a main()
#include "catch.hpp" // only do this in one cpp file
unsigned int Factorial(unsigned int number) {
   return number <= 1 ? number : Factorial(number - 1) * number;</pre>
float floatComputation() { ... }
"Test description and tag name"
TEST_CASE( "Factorials are computed", "[Factorial]" ) {
   REQUIRE( Factorial(1) == 1 ):
   REQUIRE( Factorial(2) == 2 );
   REQUIRE( Factorial(3) == 6 ):
   REQUIRE( Factorial(10) == 3628800 );
}
TEST_CASE( "floatCmp computed", "[floatComputation]" ) {
   REQUIRE( floatComputation() == Approx( 2.1 ) );
```

Code coverage is a measure used to describe the degree to which the source code of a program is executed when a particular test suite runs

 $\underline{\mathtt{gcov}}$ is a tool you can use in conjunction with GCC to test code coverage in programs

<u>lcov</u> is a graphical front-end for gcov. It collects gcov data for multiple source files and creates HTML pages containing the source code annotated with coverage information

Step for code coverage:

- compile with --coverage flag (objects + linking)
- run the test
- visualize the results with gcov or lcov

```
program.cpp:
#include <iostream>
#include <string>

int main(int argc, char* argv[]) {
    int value = std::stoi(argv[1]);
    if (value % 3 == 0)
        std::cout << "first\n";
    if (value % 2 == 0)
        std::cout << "second\n";
}</pre>
```

```
$gcc --std=c++11 --coverage program.cpp -o program
$./program 9
first
$gcov program.cpp
File 'program.cpp'
Lines executed:85.71% of 7
Creating 'program.cpp.gcov'
$lcov --capture --directory . --output-file coverage.info
$genhtml coverage.info --output-directory out
```

program.cpp.gcov:

```
1: 4:int main(int argc, char* argv[]) {
1: 5: int value = std::stoi(argv[1]);
1: 6: if (value % 3 == 0)
1: 7: std::cout << "first\n";
1: 8: if (value % 2 == 0)

#####: 9: std::cout << "second\n";
4: 10:}
```

lcov output:

Current view:	top level - /home/ubuntu/workspace/prove		Hit	Total		Coverage
Test:	coverage.info	Lines:		6	7	85.7 %
Date:	2018-02-09	Functions:		3	3	100.0 %

38/69

Coverage-Guided Fuzz Testing

A **fuzzer** is a specialized tool that tracks which areas of the code are reached, and generates *mutations* on the corpus of input data in order to *maximize* the code coverage

<u>LibFuzzer</u> is the library provided by LLVM and feeds fuzzed inputs to the library via a specific fuzzing entrypoint

```
Website: llvm.org/docs/LibFuzzer.html
```

The *fuzz target function* accepts an array of bytes and does something interesting with these bytes using the API under test:

Code Quality

lint: The term was derived from the name of the undesirable bits of fiber

clang-tidy provides an extensible framework for diagnosing and fixing typical programming errors, like style violations, interface misuse, or bugs that can be deduced via static analysis Website: clang.llvm.org/extra/clang-tidy

```
$cmake -DCMAKE_EXPORT_COMPILE_COMMANDS=ON .
$clang-tidy -p .
```

clang-tidy searches the configuration file $\underline{.clang-tidy}$ file located in the closest parent directory of the input file

clang-tidy is included in the LLVM suite

Coding Guidelines:

- CERT Secure Coding Guidelines
- C++ Core Guidelines
- High Integrity C++ Coding Standard

Supported Code Conventions:

- Fuchsia
- Google
- LLVM

ines Boost III

- Android related
- Boost library related
- Misc

Bug Related:

- Modernize
- Performance
- Readability
- clang-analyzer checks
- bugprone code constructors

.clang-tidy

```
Checks: 'android-*,boost-*,bugprone-*,cert-*,cppcoreguidelines-*, clang-analyzer-*,fuchsia-*,google-*,hicpp-*,llvm-*,misc-*,modernize-*, performance-*,readability-*'
```

Linters - vera++

 $\underline{\text{Vera++}}$ is tool for verification and analysis of C++ source code. It is complementary to clang-tidy: It provides weaker checkers, more oriented to syntax, then semantic

- well-formed file names
- space rules
- variable names
- etc.

Website: bitbucket.org/verateam/vera/wiki/Home

```
vera++ --rule <rule_list> <src_file/include_file>
vera++ --profile <profile_name> <src_file/include_file>
```

CMake

CMake Overview

 $\underline{\mathtt{CMake}}$ is an *open-source*, $\underline{\mathit{cross-platform}}$ family of tools designed to build, test and package software

Website: https://cmake.org

CMake is used to control the software compilation process using simple platform and compiler independent configuration files, and generate native Makefile/Ninjia and workspaces that can be used in the compiler environment of your choice

CMake features:

- Turing complete language
- Multi-platform (Windows, Linux, etc.)
- Open-Source
- Generate: makefiles, ninja, etc.
- Supported by many IDE: Visual Studio, Eclipse, etc.

CMake - References

- 19 reasons why CMake is actually awesome
- An Introduction to Modern CMake
- Useful Variables
- Modern CMake is like inheritance
- Effective Modern CMake
- CMake Useful Variables

CMakeLists.txt minimal example:

```
project(my_project)  # project name

add_executable(program program.cpp) # compile command
```

```
project(my_project)
                                    # project name
cmake_minimum_required(VERSION 3.15) # minimum version
set(CMAKE_CXX_STANDARD
                            14) # force C++14
set(CMAKE_CXX_STANDARD_REQUIRED ON)
                         OFF)
set(CMAKE CXX EXTENSIONS
add_executable(program)
# indicate include directory
target_include_directories(program
    PUBLIC "${PROJECT_SOURCE_DIR}/include")
# find all .cpp file in src/ directory
file(GLOB_RECURSE SRCS ${PROJECT_SOURCE_DIR}/src/*.cpp)
# compile all *.cpp file
target_sources(program PRIVATE ${SRCS})
```

```
project(my_project)
                                          # project name
cmake_minimum_required(VERSION 3.15) # minimum version
add_executable(program)
if (CMAKE_BUILD_TYPE STREQUAL "Debug") # "Debug" mode
   target_compile_options(program "-g")
   target_compile_options(program "-01")
   if (CMAKE COMPILER IS GNUCXX) # if compiler is qcc
       target_compile_options(program "-ggdb3")
   endif()
elseif (CMAKE_BUILD_TYPE STREQUAL "Release") # "Release" mode
   target_compile_options(program "-02")
endif()
target_sources(program PRIVATE program.cpp)
```

```
$ cmake -DCMAKE_BUILD_TYPE=Debug .
```

```
project(my_project)
                     # project name
cmake_minimum_required(VERSION 3.15) # minimum version
add custom target(rm
                             # makefile target name
                 COMMAND rm -rf *.o # real command
                 COMMENT "Clear build directory")
add_executable(program)
find_package(Boost 1.36.0 REQUIRED) # compile only if Boost library
                                    # is found
if (Boost FOUND)
   target include directories("${PROJECT SOURCE DIR}/include"
                              PUBLIC ${Boost INCLUDE DIRS})
else()
   message(FATAL_ERROR "Boost Lib not found")
endif()
target_sources(program PRIVATE program.cpp)
```

```
$ cmake .
$ make rm
```

Generate JSON compilation database (compile_commands.json) It contains the exact compiler calls for each file (used by other tools)

```
project(my_project)  # project name
cmake_minimum_required(VERSION 3.15) # minimum version

set(CMAKE_EXPORT_COMPILE_COMMANDS ON) # <--
add_executable(program)
target_sources(program PRIVATE program.cpp)</pre>
```

Change the compiler:

```
CC=gcc CXX=g++ cmake .
```

<u>CTest</u> is a testing tool (integrated in CMake) that can be used to automate updating, configuring, building, testing, performing memory checking, performing coverage

```
project(my_project)
cmake_minimum_required(VERSION 3.5)
add_executable(program program.cpp)
enable testing()
add_test(NAME Test1 # check if "program" returns 0
         WORKING DIRECTORY ${PROJECT SOURCE DIR}/build
         COMMAND ./program <args>) # command can be anything
add test(NAME Test2 # check if "program" print "Correct"
         WORKING DIRECTORY ${PROJECT SOURCE DIR}/build
         COMMAND ./program <args>)
set_tests_properties(Test2
                    PROPERTIES PASS REGULAR EXPRESSION "Correct")
```

Basic usage (call ctest):

```
$make test  # run all tests
```

ctest usage:

```
$ctest -R Python  # run all tests that contains 'Python' string
$ctest -E Iron  # run all tests that not contain 'Iron' string
$ctest -I 3,5  # run tests from 3 to 5
```

Each ctest command can be combined with other tools (e.g. valgrind)

Code Commenting

<u>Doxygen</u> is the de facto standard tool for generating documentation from annotated C++ sources

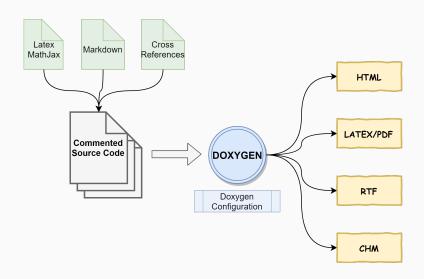

Doxygen usage

- comment the code with /// or /** comment */
- generate doxygen base configuration file

```
$doxygen -g
```

- modify the configuration file doxygen.cfg
- generate the documentation

```
$doxygen <config_file>
```

Doxygen provides support for:

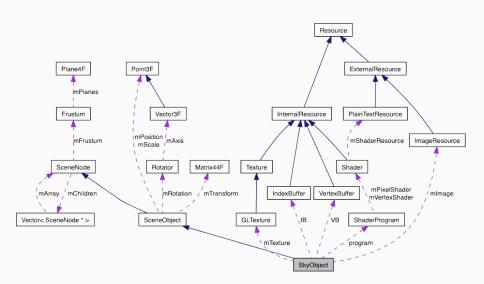

- Latex/MathJax Insert latex math \$<code>\$
- Markdown (Markdown Cheatsheet link) Italic text *<code>*, bold text **<code>**, table, list, etc.
- Automatic cross references Between functions, variables, etc.
- Specific highlight Code `<code>`, parameter
 @param <param>

Doxygen guidelines:

- Include in every file copyright, author, date, version
- Comment namespaces and classes
- Comment template parameters
- Distinguish input and output parameters
- Call/Hierarchy graph can be useful in large projects
 (should include graphviz)
 HAVE_DOT = YES
 GRAPHICAL_HIERARCHY = YES
 CALL_GRAPH = YES
 CALLER_GRAPH = YES

Code Statistics

Count Lines of Code (cloc)

\$cloc my_project/

4076 text files.

Website: cloc.sourceforge.net

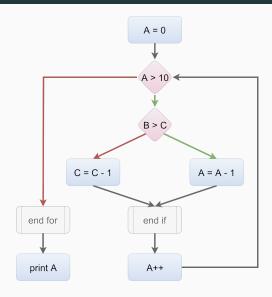

Features: filter by-file/language, SQL database, archive support, line count diff, etc. 58/69

Cyclomatic Complexity Analyzer - 1yzard)

Website: github.com/terryyin/lizard

Cyclomatic Complexity: is a software metric used to indicate the complexity of a program. It is a quantitative measure of the number of linearly independent paths through a program source code

- CCN: cyclomatic complexity (should not exceed a threshold)
- NLOC: lines of code without comments
- token: Number of conditional statements
- param: Parameter count of functions

CCN = 3 60/69

СС	Risk Evaluation
1-10	a simple program, without much risk
11-20	more complex, moderate risk
21-50	complex, high risk
> 50	untestable program, very high risk

CC	Guidelines
1-5	The routine is probably fine
6-10	Start to think about ways to simplify the routine
> 10	Break part of the routine

Risk: Lizard: 15, OCLint: 10

Other Tools

Code Formatting - clang-format

 $\underline{\mathtt{clang-format}}$ is a tool to automatically format C/C++ code (and other languages)

Website: clang.llvm.org/docs/ClangFormat.html

```
$ clang-format <file/directory>
```

clang-format searches the configuration file $\underline{.clang-format}$ file located in the closest parent directory of the input file

clang-format example:

```
IndentWidth: 4
UseTab: Never
```

BreakBeforeBraces: Linux

ColumnLimit: 80
SortIncludes: true

Compiler Explorer (assembly and execution)

<u>Compiler Explorer</u> is an interactive tool that lets you type source code and see assembly output, control flow graph, optimization hint, etc.

Website: godbolt.org

```
x86-64 clang 5.0.0
                                                                     Compiler options...

                                                    ret
```

Key feature: support multiple architectures and compilers

Code Transformation - CppInsights

CppInsights See what your compiler does behind the scenes Website: cppinsights.io

```
About
Source:
  1 #include <cstdio>
  2 #include <vector>
  4 int main()
  5 {
       const char arr[10]{2,4,6,8};
  7
  8
       for(const char& c : arr)
  9
 10
          printf("c=%c\n", c);
 12 }
```

```
Insight:
  1 #include <cstdio>
  2 #include <vector>
  4 int main()
  5 {
      const char arr[10]{2,4,6,8};
           auto&& range1 = arr;
 10
      const char * __begin1 = __range1;
      const char * end1 = range1 + 101;
          for( ; begin1 != __end1; ++__begin1 )
 14
           const char & c = *__begin1;
             printf("c=%c\n", static cast<int>(c));
 16
 18
 19 }
```

Code Autocompletion - TabNine

TabNine uses deep learning to provide code completion

Website: tabnine.com

Features:

- Project indexing
- Recognize common language patterns
- Use even the documentation to infer this function name, return type, and arguments
- Semantic completion is available through clangd

```
2 import sys
5 def main(directorv):
     line_count =
      for filename in os.listdir(directory):
          _, ext = os.path.splitext(filename)
            ext not in line count:
              line count[ext]
          for line in open(os.path.join(directory, filename)):
              line count[ext] += 1
              line count[ext] += 1
                                                 13%
              line count[ext
                                            Tab 20%
              line count[ext] +=
                                               14%
              line_count[ext].append(
              line
                                                23%
```

Local Code Search - ripgrep

Ripgrep is a code-searching-oriented tool for regex pattern Website: github.com/BurntSushi/ripgrep

Features:

- Default recursively searches
- Skip .gitignore patterns, binary and hidden files/directories
- Windows, Linux, Mac OS support
- Up to 100x faster than GNU grep

```
[andrew@Cheetah rust] rg -i rustacean src/doc/book/nightly-rust.md 92:[Mibbit][mibbit]. Click that link, and you'll be chatting with other Rustaceans src/doc/book/glossary.md 3:Not every Rustacean has a background in systems programming, nor in computer src/doc/book/getting-started.md 176:Rustaceans (a silly nickname we call ourselves) who can help us out. Other great 376:Cargo is Rust's build system and package manager, and Rustaceans use Cargo to src/doc/book/guessing-game.md 444:it really easy to re-use libraries, and so Rustaceans tend to write smaller CONTRIBUTING.md 322:' [rustaceans.org][ro] is helpful, but mostly dedicated to IRC 333:[ro]: http://www.rustaceans.org/[andrew@Cheetah rust] [

Code Search Engine - searchcode

Searchcode is a free source code search engine

Website: searchcode.com

Features:

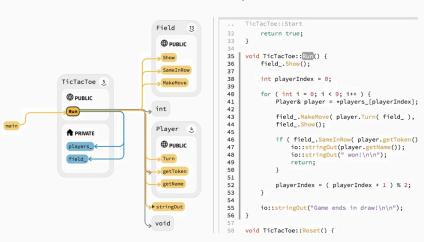

- Search over 20 billion lines of code from 7,000,000 projects
- Search sources: github, bitbucket, gitlab, google code, sourceforge, etc.

Code Exploration - SourceTrail

Sourcetrail is an interactive code explorer that simplifies navigation in complex source code

Website: www.sourcetrail.com/#intro

Code Benchmarking - Quick-Bench

Quick-benchmark is a micro benchmarking tool intended to quickly and simply compare the performances of two or more code snippets. The benchmark runs on a pool of AWS machines

Website: quick-bench.com
